

Shipping Container Desiccants

Ever since goods and products have been transported by ocean going vessels, sweating and condensation in cargo areas has been a problem.

The main reason for using a desiccant is to actively reduce the Relative Humidity inside the container by collecting water molecules from the air.

SUPERDRY works by absorbing moisture and converting the resultant mixture to a gel, holding the moisture and not releasing it back into the containers climate. It absorbs 130% of its dry weight.

Our range of desiccants provide a highly efficient cost-effective solution to your moisture problems, and ensure that your high-value goods arrive in perfect condition.

Superdry Sac / Marine, Vehicle Desiccant Pack

SUPERDRY SAC is a one-time use non toxic, recyclable product made using food grade materials that actively reduces the humidity inside the box or pallet. It can have various placement positions: simply flat, suspended or hanging, to suit any cargo. It works by absorbing moisture and converting the resultant mixture to a gel, holding the moisture and not releasing it back into the containers climate. It absorbs 130% of its dry weight. Ideal for boats and recreational vehicles.

SUPERDRY SAC is available in a range of sizes from 2g up to 1400g.
